

● Verdict — this is a professional, well-built operations dashboard

MMU Operations dashboard — design review

The product is genuinely solid: coherent navy/orange system, strong six-section IA, persistent global filters, clean exportable tables, and real domain intelligence. The notes below are **data-viz discipline and client-readiness**, not a rebuild. Each is shown as **current** → **improved**, built in Recharts so it maps onto your Next.js code. Brand navy + orange stays locked.

01 Make colour mean something HIGH IMPACT · EASY

Across the bar charts, every category is a different colour — but the colour **encodes nothing**. A reader's eye hunts for meaning that isn't there. Rule of thumb: if colour doesn't carry data, use one brand colour and spend colour only on the thing you want acted on. Your RAG compliance bars already do this perfectly — extend that discipline everywhere else.

Current

Missing shift-end logs by operator

Rainbow palette — colour is decorative, not informative.

Improved

Missing shift-end logs by operator

One brand navy; orange spent only on the actionable outlier; values inline.

Recharts: one fill on <Bar>, a single <Cell> for the outlier, <LabelList> for values. Sorted desc so rank reads instantly.

02 Stop the false alarm on utilization HIGH IMPACT

You confirmed low utilization **isn't** an alarm — yet the RAG thresholds paint almost every day red, so the chart screams "everything's on fire." Red is the most expensive colour on a screen; reserve it for genuine exceptions (safety, breakdowns). Reframe as performance-vs-target: neutral bars, a dashed target line, and green only when a day *beats* target — so the eye rewards good days instead of panicking at normal ones.

Current

Fleet utilization — MMUs loading / day

green $\geq \frac{2}{3}$ · amber $\geq \frac{1}{3}$ · red $< \frac{1}{3}$ of fleet — i.e. a sea of red.

Improved

Fleet utilization — MMUs loading / day

Neutral bars · dashed target line · green only when a day beats target.

Recharts: <ReferenceLine y={target}> with a label, neutral fill, <Cell> green only where $v \geq \text{target}$.

03 Let the KPI cards triage for you MEDIUM · CLIENT-FACING

The snapshot numbers all sit in the same neutral navy, so **"Missing shift-ends 66%"** — a real problem — looks identical to a healthy count. Give the cards a job: a thin status accent, a one-line "vs previous period" delta, and a sparkline for direction. An Orica account manager should know what needs attention before reading a single label.

Current

Site snapshot — as built

Clean, but every metric reads as equally neutral.

Shift sessions

88

Active MMUs

11

Missing shift-ends

58

66% of sessions

Pre-start faults

17

Improved

Site snapshot — status-aware

Accent + delta + sparkline draw the eye to what's off.

Shift sessions

▲ 2

Missing shift-ends

58

66% of sessions

Pre-start faults

17

▲ 3 vs prev

Problem metrics get an amber/red top accent and a **vs-previous** chip; healthy ones stay quiet. Same data, instant triage.

04 Arm the client conversation: waiting ≠ idle

HIGHEST LEVERAGE · NEW LENS

This is the one that earns its keep. You said the real value for Orica is **defending operators when the mine gets accusatory** — proving time was lost *waiting on the mine* (explosives, personnel) rather than slacking off. Right now that story is two thin slices in a 12-category donut nobody can parse. Promote it to a dedicated **responsibility lens**: bucket every logged hour into who owns the time. The amber "waiting on mine" band becomes the exhibit you put in front of the mine.

Current

Fleet-wide activity mix

12 categories, wrapping legend, clashing hues — the key story is invisible.

Improved

Where the shift went — by responsibility

Every logged hour bucketed by who owns it. One bar, one argument.

■ Loading Explosives 27 % ■ Travel 27 % ■ Reload 13 % ■ Toolbox Talk 11 %
■ FQMO - Dipping & Priming 10 % ■ Other 12 %

The pitch: "7% of fleet time was your guys **waiting on mine-supplied explosives & personnel** — here's the logged evidence." Drill into amber for the operator/date/bench detail you already capture. Keep the grouped donut (right) as the secondary "what were they doing" view.

How this maps to your stack (Next.js · Tailwind · Recharts)

- **One palette object.** Put navy/orange/RAG into Tailwind theme tokens and a `chartColors.ts`; pass `fill` from there. Use `<Cell>` only to highlight an exception, never to decorate categories.
- **Targets over thresholds.** Replace count-based RAG with `<ReferenceLine>` + a single accent for "beat target." Keep red strictly for safety/breakdown exceptions.
- **Status-aware cards.** A small `<StatCard status="bad|warn|ok">` with optional delta + sparkline, reused across all four KPI rows.
- **Responsibility bucketing.** Map your existing activity categories → { Productive, Movement, Safety/Admin, Waiting-on-mine, Idle, Breakdown } once, server-side; everything downstream (overview bar, per-MMU, per-operator, CSV) reads the bucket. This is the client-facing differentiator.
- **Polish pass:** sentence-case all chart titles (mix of Title/UPPER today), right-align numeric table columns, and collapse single-row charts (n=1 operator) into a stat line instead of one giant bar.
